

# **Two-View Geometry: Epipolar Geometry and the Fundamental Matrix**

簡韶逸 Shao-Yi Chien

Department of Electrical Engineering

National Taiwan University

# Outline

- Epipolar geometry and the fundamental matrix

[Slides credit: Marc Pollefeys]

# Three Questions

- **Correspondence geometry:** Given an image point  $x$  in the first view, how does this constrain the position of the corresponding point  $x'$  in the second image?
- **Camera geometry (motion):** Given a set of corresponding image points  $\{x_i \leftrightarrow x'_i\}$ ,  $i=1, \dots, n$ , what are the cameras  $P$  and  $P'$  for the two views?
- **Scene geometry (structure):** Given corresponding image points  $x_i \leftrightarrow x'_i$  and cameras  $P, P'$ , what is the position of (their pre-image)  $X$  in space?

# The Epipolar Geometry

$C, C', x, x'$  and  $X$  are coplanar

# The Epipolar Geometry

What if only  $C, C', x$  are known?

# The Epipolar Geometry

All points on  $\pi$  project on  $l$  and  $l'$

# The Epipolar Geometry

Family of planes  $\pi$  and lines  $l$  and  $l'$   
Intersection in  $e$  and  $e'$

# The Epipolar Geometry

## Epipoles $e, e'$

= intersection of baseline with image plane

= projection of projection center in other image

= vanishing point of camera motion direction

an epipolar plane = plane containing baseline (1-D family)

an epipolar line = intersection of epipolar plane with image  
(always come in corresponding pairs)

# Example: Converging Cameras

# Example: Motion Parallel with Image Plane

# Example: Forward Motion

# The Fundamental Matrix F

Algebraic representation of epipolar geometry

$$x \mapsto l'$$

we will see that mapping is (singular) correlation  
(i.e. projective mapping from points to lines)  
represented by the fundamental matrix F

# The Fundamental Matrix F

geometric derivation

$$x' = H_\pi x$$

$$l' = e' \times x' = [e']_x H_\pi x = Fx$$

If  $\mathbf{a} = (a_1, a_2, a_3)^T$

$$[\mathbf{a}]_x = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix}$$

mapping from 2-D to 1-D family (rank 2)

# The Fundamental Matrix F

algebraic derivation

$$X(\lambda) = P^+ x + \lambda C$$

$$l' = \underbrace{P' C}_{e'} \times P' P^+ x$$

$$F = [e']_{\times} P' P^+$$

$$(P P^+ = I)$$

(note: doesn't work for  $C=C' \Rightarrow F=0$ )

# The Fundamental Matrix F

correspondence condition

The fundamental matrix satisfies the condition that for any pair of corresponding points  $x \leftrightarrow x'$  in the two images

$$x'^T F x = 0 \quad (x'^T 1' = 0)$$

# The Fundamental Matrix F

F is the unique 3x3 rank 2 matrix that satisfies  
 $x'^T F x = 0$  for all  $x \leftrightarrow x'$

- (i) **Transpose:** if F is fundamental matrix for (P,P'), then  $F^T$  is fundamental matrix for (P',P)
- (ii) **Epipolar lines:**  $l' = Fx$  &  $l = F^T x'$
- (iii) **Epipoles:** on all epipolar lines, thus  $e'^T F x = 0, \forall x \Rightarrow e'^T F = 0$ , similarly  $F e = 0$
- (iv) **F** has 7 d.o.f. , i.e.  $3 \times 3 - 1(\text{homogeneous}) - 1(\text{rank} 2)$
- (v) **F** is a correlation, projective mapping from a point x to a line  $l' = Fx$  (not a proper correlation, i.e. not invertible)

# The Epipolar Line Geometry

$l, l'$  epipolar lines,  $k$  line not through  $e$   
 $\Rightarrow l' = F[k]_{\times} l$  and symmetrically  $l = F^T[k']_{\times} l'$

(pick  $k=e$ , since  $e^T e \neq 0$ )

$$l' = F[e]_{\times} l \quad l = F^T[e']_{\times} l'$$

# Fundamental Matrix for Pure Translation

# Fundamental Matrix for Pure Translation

# Fundamental Matrix for Pure Translation

$$\text{If } P=K[ I \mid 0], P'=K'[ R \mid t] \quad F = [e']_x H_\infty \quad H_\infty = (K'RK^{-1})$$

example:

$$P=K[ I \mid 0], P'=K[ I \mid t]$$

$$F = [e']_x H_\infty = [e']_x$$

Translation is parallel to the x-axis

$$e' = (1,0,0)^T \quad F = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{bmatrix}$$

$$x'^T F x = 0 \Leftrightarrow y = y'$$

# Fundamental Matrix for Pure Translation

$$\mathbf{x} = \mathbf{P}\mathbf{X} = \mathbf{K}[\mathbf{I} \mid \mathbf{0}]\mathbf{X}$$

$$(\mathbf{X}, \mathbf{Y}, \mathbf{Z})^\top = \mathbf{Z}\mathbf{K}^{-1}\mathbf{x}$$

$$\mathbf{x}' = \mathbf{P}'\mathbf{X} = \mathbf{K}[\mathbf{I} \mid \mathbf{t}]\mathbf{X}$$

$$\mathbf{x}' = \mathbf{x} + \mathbf{K}\mathbf{t}/\mathbf{Z}$$

motion starts at  $\mathbf{x}$  and moves towards  $\mathbf{e}$ , faster depending on  $\mathbf{Z}$

pure translation: F only 2 d.o.f.,  $\mathbf{x}^\top[\mathbf{e}]_x \mathbf{x} = 0 \Rightarrow$  auto-epipolar

# General Motion

$$\mathbf{x}'^T [\mathbf{e}']_{\mathbf{x}} \mathbf{H} \mathbf{x} = 0$$

$$\mathbf{x}'^T [\mathbf{e}']_{\mathbf{x}} \hat{\mathbf{x}} = 0$$

$$\mathbf{x}' = \mathbf{K}' \mathbf{R} \mathbf{K}^{-1} \mathbf{x} + \mathbf{K}' \mathbf{t} / Z$$

# Projective Transformation and Invariance

Derivation based purely on projective concepts

$$\hat{\mathbf{x}} = \mathbf{H}\mathbf{x}, \hat{\mathbf{x}}' = \mathbf{H}'\mathbf{x}' \Rightarrow \hat{\mathbf{F}} = \mathbf{H}'^{-T} \mathbf{F} \mathbf{H}^{-1}$$

F invariant to transformations of projective 3-space

$$\mathbf{x} = \mathbf{P}\mathbf{X} = (\mathbf{P}\mathbf{H})(\mathbf{H}^{-1}\mathbf{X}) = \hat{\mathbf{P}}\hat{\mathbf{X}}$$

$$\mathbf{x}' = \mathbf{P}'\mathbf{X} = (\mathbf{P}'\mathbf{H})(\mathbf{H}^{-1}\mathbf{X}) = \hat{\mathbf{P}}'\hat{\mathbf{X}}$$

Same matching point!

$$(\mathbf{P}, \mathbf{P}') \mapsto \mathbf{F} \quad \text{unique}$$

$$\mathbf{F} \mapsto (\mathbf{P}, \mathbf{P}') \quad \text{not unique}$$

canonical form

$$\begin{aligned} \mathbf{P} &= [\mathbf{I} \mid \mathbf{0}] \\ \mathbf{P}' &= [\mathbf{M} \mid \mathbf{m}] \end{aligned} \quad \mathbf{F} = [\mathbf{m}]_{\times} \mathbf{M}$$

# Canonical Cameras Given F

F matrix corresponds to P,P' iff  $P'^T F P$  is skew-symmetric

$$(X^T P'^T F P X = 0, \forall X)$$

F matrix, S skew-symmetric matrix

$$P = [I \mid 0] \quad P' = [SF \mid e'] \quad (\text{fund.matrix}=F)$$

$$\left( [SF \mid e']^T F [I \mid 0] = \begin{bmatrix} F^T S^T F & 0 \\ e'^T F & 0 \end{bmatrix} = \begin{bmatrix} F^T S^T F & 0 \\ 0 & 0 \end{bmatrix} \right)$$

Possible choice:

$$P = [I \mid 0] \quad P' = [[e']_{\times} F \mid e']$$

Canonical representation:

$$P = [I \mid 0] \quad P' = [[e']_{\times} F + e' v^T \mid \lambda e']$$

# The Essential Matrix

$\equiv$  fundamental matrix for calibrated cameras (remove K)

$$E = [t]_{\times} R = R[R^T t]_{\times}$$

$$\hat{x}'^T E \hat{x} = 0 \quad \left( \hat{x} = K^{-1} x; \hat{x}' = K'^{-1} x' \right)$$

$$E = K'^T F K$$

5 d.o.f. (3 for R; 2 for t up to scale)

E is essential matrix if and only if  
two singularvalues are equal (and third=0)

$$E = U \text{diag}(1,1,0) V^T$$

Given E,  $P=[I|0]$ , there are 4 possible choices for the second camera matrix  $P'$

$$P' = [UWV^T \mid +\mathbf{u}_3] \text{ or } [UWV^T \mid -\mathbf{u}_3] \text{ or } [UW^T V^T \mid +\mathbf{u}_3] \text{ or } [UW^T V^T \mid -\mathbf{u}_3]$$

# Four Possible Reconstructions from E

(a)

(b)

(c)

(d)

(only one solution where points is in front of both cameras)
